1 Cut a rectangular window in the box as shown.

2 Stick black paper inside the box. The black background will make the smoke visible.

3 Make two cylinders from a transparency and fix them tightly in the holes.

4 Place a lighted candle below the left chimney inside the box.

5 Light an incense stick and hold it on the right chimney.

6 The incense smoke will be sucked in from the right chimney and will exit from the left chimney.

Hot air being lighter will rise up from the left chimney. This will suck in smoke from the right chimney. In the process, you will see beautiful convection currents.
